

FINANCIAL ANALYTICS • CONFIDENTIAL

Profit & Loss Analysis Report

A comprehensive review of revenue, profitability, and cost structure across regions, products, and customers for the trailing twelve-month period.

REPORTING PERIOD

Jul 2024 - Jun 2025

DATA SOURCE

P&L Transaction Dataset

PREPARED

05 September 2026

Headline KPIs (Trailing Twelve Months)

\$149.16M TOTAL REVENUE	\$63.37M GROSS PROFIT	\$33.59M EBITDA	\$25.10M NET PROFIT
42.49% GROSS MARGIN	22.52% EBITDA MARGIN	16.83% NET MARGIN	499 TRANSACTIONS

Executive Summary

Purpose. This report evaluates profitability and cost structure across 499 transaction records spanning July 2024 to June 2025, covering four regions, twenty products, and 220 customers. The objective is to assess where the business is performing efficiently, where margin is being left on the table, and to verify that the figures feeding executive reporting are correct.

Data source and approach. The underlying dataset is a transaction-level P&L extract with Revenue, COGS, Operating Expense, Interest, and Tax recorded per transaction, from which Gross Profit, EBITDA, and Net Profit are derived. Every derived figure was independently recalculated from its components and reconciled against the dataset's own totals and the source dashboard before being used in this report.

Top three findings: First, underlying profitability is healthy and stable — a 42.49% gross margin, 22.52% EBITDA margin, and 16.83% net margin hold within a narrow band every month of the year, indicating a cost structure that scales predictably with revenue rather than one exposed to lumpy fixed costs. Second, regional performance is uneven in a way that isn't visible from revenue alone: the East region ranks 2nd of 4 by revenue (\$39.39M) but has the *lowest* net profit margin of any region (16.43%), while North leads on both revenue and margin. Third, this analysis surfaced a data-integrity issue in the source dashboard — the "Gross Profit" and "EBITDA" KPI cards, and the two profit-margin cards beside them, are showing each other's figures rather than their own, which we detail in Section 2.

Taken together, the business is fundamentally healthy — profitable, stable, and not overly dependent on any single customer — but the East region's revenue-to-margin disconnect and the dashboard labelling error both warrant prompt attention, the second because it is actively misleading anyone reading the dashboard today.

Dataset Overview

The workbook contains 499 transaction records across 20 columns, fully populated with no missing values in any field. Each row combines a P&L transaction — Region, Product, Business Unit, Customer, Revenue, COGS, Operating Expense, Interest, and Tax — with a separate embedded budget-tracking tag (Financial Metric, Actual, Budget) used to power the dashboard's "Budget vs Actual YTD" panel. The reporting window runs from 15 July 2024 to 15 June 2025 — a rolling twelve-month period rather than a calendar year, so year-over-year comparisons should be read as period-over-period rather than fiscal-year-over-fiscal-year.

Key Variables

VARIABLE	TYPE	ROLE IN ANALYSIS
Revenue, COGS, Operating Expense, Interest, Tax	Numeric (input)	Base P&L line items
Gross Profit, EBITDA, Net Profit	Numeric (derived)	Profitability measures, verified against inputs
Region, Business Unit	Categorical (4 levels each)	Geographic / organisational cut — verified independent of each other (see below)
Product	Categorical (20 levels)	Portfolio performance
Customer	Categorical (220 levels)	Concentration analysis
Financial Metric, Actual, Budget	Categorical + numeric	Separate YTD budget-tracking series (different scale — see below)

Coverage and Completeness

All 20 columns are 100% populated across all 499 rows — no missing-data remediation was required for this dataset, a notable contrast to typical survey- or form-collected data.

Quality Checks and Data-Integrity Findings

Dashboard KPI mislabelling (high priority). Cross-checking the source dashboard against the underlying data shows two pairs of KPI cards are displaying each other's values:

DASHBOARD CARD LABEL	DASHBOARD SHOWS	ACTUALLY MATCHES	CORRECT VALUE
"Gross Profit"	\$33.59M	EBITDA (Revenue – COGS – OpEx)	\$33.59M
"EBITDA"	\$63.37M	Gross Profit (Revenue – COGS)	\$63.37M
"Gross Profit Margin"	16.83	Net Profit Margin (Net Profit ÷ Revenue)	16.83%
"Net Profit Margin"	22.52	EBITDA Margin (EBITDA ÷ Revenue)	22.52%

The dashboard's own arithmetic is correct — every figure it displays does tie back to the underlying data — but the labels on these four cards are swapped with their neighbours. The dashboard's true Gross Profit (\$63.37M, a 42.49% margin) and true Net Profit Margin (16.83%) are not shown under their correct names anywhere on the current dashboard. This is corrected throughout the rest of this report, and flagged as Recommendation 1 in Section 6.

- Formula verification:** Gross Profit = Revenue – COGS, EBITDA = Gross Profit – Operating Expense, and Net Profit = EBITDA – Interest – Tax all tie out exactly across every transaction sampled and at the full-dataset level, confirming the derived fields are computed consistently.
- Region and Business Unit are independent fields, not a hierarchy:** a cross-tabulation shows each Region's transactions are spread almost evenly across all four Business Units (e.g. East-region transactions split 32/35/30/30 across the four "...Region" business units) rather than concentrating in the correspondingly-named unit. The two fields should be treated as separate cuts of the data, not as a region-and-its-subdivision pair.
- Budget-tracking series operates at a different scale:** the embedded Financial Metric / Actual / Budget series totals roughly 10.3× the transaction-level Revenue sum (\$1,538.75M actual vs. \$149.16M in the transaction data), indicating it reflects a broader company-wide YTD figure rather than this transaction sample. It is analysed on its own terms in Section 4, Track E, and should not be reconciled line-for-line against the transaction totals elsewhere in this report.

Analytical Framework

The analysis follows a five-stage workflow designed to move from raw transaction data to decision-ready findings while keeping every figure traceable back to a source value.

1 DESCRIPTION Catalogue the dataset's structure, fields, and completeness.	2 INQUIRY Frame the questions that matter: where is margin strong or weak, and can the reporting be trusted?	3 GOAL SETTING Define the cuts needed: time, region, product, customer, and budget variance.	4 ANALYSIS Compute and independently verify every P&L figure against its formula and the source dashboard.	5 VISUALISATION Render trends and comparisons as charts to surface patterns not visible in raw tables.
---	---	---	---	---

This structure supports three things a finance audience needs from an analytical report:

- **Rigour** — every P&L figure (Gross Profit, EBITDA, Net Profit, and all margins) is recalculated directly from Revenue, COGS, Operating Expense, Interest, and Tax, not taken on trust from a dashboard label.
- **Transparency** — the formula behind each metric is stated alongside its first use, so a reader can recompute any figure from the transaction data.
- **Traceability** — every chart and table in Section 4 draws from the same 499-transaction dataset, so findings can be cross-checked against a single, consistent source rather than blended reports.

Detailed Findings by Analytical Track

Track A — Overall Profitability and Trend

Revenue flows through the P&L in a consistent, predictable pattern: a 42.49% gross margin absorbs the cost of goods sold, operating expense takes the business to a 22.52% EBITDA margin, and interest and tax bring net margin to 16.83%.

Figure 1. Revenue-to-Net-Profit bridge for the full period. COGS is by far the largest deduction (57.5% of revenue), more than four times the combined impact of Operating Expense, Interest, and Tax.

Figure 2. Monthly revenue ranges from \$11.70M (Jul) to \$13.34M (Jan), a spread of roughly 14% around the monthly average of \$12.43M — mild seasonality with no missing or anomalous months.

Figure 3. Gross, EBITDA, and Net margins recalculated directly from transaction data. All three hold within a tight band every month (Gross ~42%, EBITDA ~21-25%, Net ~15-19%), confirming margin stability is not an artefact of annual averaging.

What this means in simple terms: the business's cost structure scales cleanly with revenue — margins don't compress in slower months or expand in stronger ones — which suggests costs are largely variable rather than fixed, and that profitability is predictable regardless of month-to-month revenue swings.

Track B — Regional Performance

North leads on both revenue and margin. East is the standout exception: it generates the second-highest revenue but converts it to profit less efficiently than any other region.

Figure 4. North (\$44.3M) leads all regions in revenue, gross profit, and net profit; South is smallest on all three measures.

REGION	REVENUE	GROSS MARGIN	EBITDA MARGIN	NET MARGIN
North	\$44.31M	42.33%	23.08%	17.25%
West	\$33.16M	42.47%	22.75%	17.03%
South	\$32.30M	42.66%	22.20%	16.52%
East	\$39.39M	42.53%	21.97%	16.43%

Figure 5. Gross margins are nearly identical across regions (42.3–42.7%), but the gap widens at EBITDA and Net Profit level — meaning the regional profitability gap originates in operating expense, interest, or tax, not in product cost or pricing.

What this means in simple terms: East isn't a weak-revenue region — it's a weak-conversion region. Whatever is driving its lower margin sits below the gross-profit line, in operating costs, financing, or tax, not in what it charges customers or pays suppliers.

Track C — Product Portfolio Performance

Net profit margin varies far more by product (13.36–18.92%, a 5.6-point spread) than it does by region (16.43–17.25%, less than 1 point), making product mix a bigger margin lever than regional focus.

Figure 6. Each bubble is one product, sized by revenue. Mechanical Keyboard, Wireless Mouse, and Bluetooth Speaker combine above-average revenue with the highest margins (~18.8–18.9%); Ergonomic Mouse, Office Printer, and 4K Monitor 32 sit at the bottom on margin (13.4–13.6%) despite mid-pack revenue.

What this means in simple terms: a handful of accessory products (keyboards, mice, speakers) are quietly the most profitable items in the catalogue relative to their revenue, while some higher-consideration items (printers, monitors) are the least — worth a closer look at whether pricing or supplier cost is behind the gap.

Track D — Customer Base and Concentration

Revenue is well distributed across a 220-customer base, with no single customer or small group representing an outsized share.

Figure 7. The top 10 customers each contribute between \$1.05M and \$1.13M — a narrow range indicating no single dominant account.

What this means in simple terms: the top 10 customers (4.5% of the customer base) account for just 7.26% of total revenue — there is no customer-concentration risk here; losing any one account, even the largest, would not meaningfully dent overall revenue.

Track E — Budget vs Actual (YTD Tracking Series)

Recall from Section 2 that this series runs at roughly 10.3× the scale of the transaction-level data and reflects a separate, broader reporting scope. Within its own terms, performance against budget is favourable on every measure.

Figure 8. Revenue, Gross Profit, and Net Profit all came in +8.7% ahead of budget; Operating Expenses came in 4.8% under budget — a consistently favourable variance pattern across every tracked metric.

What this means in simple terms: on the metrics tracked in this series, the business is beating its own plan across the board — spending less than budgeted while earning more — though because this series sits at a different scale than the transaction data analysed elsewhere in this report, it should be treated as a separate, higher-level confirmation rather than a line-by-line match to the regional and product findings above.

Cross-Domain Insights and Implications

Viewed together, the trend, regional, product, and customer tracks reveal patterns that are not obvious from any single analysis in isolation.

Pattern 1 — East's Margin Gap Originates Below the Gross-Profit Line

East's gross margin (42.53%) is within 0.13 points of the regional average — essentially identical to North, West, and South. Yet East's net margin (16.43%) trails North's (17.25%) by 0.82 points. Since the gap barely exists at the gross-profit level but widens steadily through EBITDA and net profit, the cause sits in operating expense, interest, or tax — not in what East charges customers or pays for goods. This is a more specific, more actionable diagnosis than "East underperforms."

Pattern 2 — Product Mix Is a Bigger Lever Than Regional Reallocation

The margin spread across products (5.6 points, from 13.36% to 18.92%) is roughly six times wider than the spread across regions (0.82 points). A strategy focused on shifting sales mix toward the highest-margin products (Mechanical Keyboard, Wireless Mouse, Bluetooth Speaker) has substantially more margin upside available than any plausible regional reallocation of effort.

Pattern 3 — Stability and Diversification Reduce Downside Risk

Two separate findings compound to reduce the business's risk profile: monthly margins hold within a tight band all year (Pattern from Track A), and no customer or small group of customers drives an outsized share of revenue (Track D). Together, these suggest the business is not exposed to a single-month shock or a single-account loss in the way a more concentrated or seasonal business would be.

Risk to Note

The dashboard KPI mislabelling identified in Section 2 means that, until corrected, anyone reading the live dashboard is seeing the true Gross Profit figure under the "EBITDA" label and vice versa — a 1.9× difference between the two mislabelled figures (\$63.37M vs \$33.59M). Any decision made from the dashboard in its current state risks being based on a metric other than the one named.

Strategic Recommendations

1 Correct the Dashboard KPI Labels Immediately

The "Gross Profit"/"EBITDA" card pair and the "Gross Profit Margin"/"Net Profit Margin" card pair are each showing the other's value (Section 2). This is a low-effort, high-priority fix — relabelling four existing cards — that should be actioned before the dashboard is used for any further reporting or decision-making, since the current labels actively misstate two of the business's most-referenced metrics.

2 Investigate East Region's Below-the-Line Cost Structure

With gross margin essentially at parity with other regions but net margin the lowest of the four, East's profitability gap is concentrated in operating expense, interest, or tax. A focused review of East's cost allocations in these three areas — rather than its pricing or supplier terms, which appear healthy — is the most direct path to closing the 0.82-point margin gap to North.

3 Shift Product Mix Toward High-Margin Accessories

Mechanical Keyboard, Wireless Mouse, and Bluetooth Speaker each carry a ~18.8–18.9% net margin against a 16.6% portfolio average, while Ergonomic Mouse, Office Printer, and 4K Monitor 32 sit at 13.4–13.6%. Prioritising the former group in promotions, bundling, and sales incentives — or investigating whether the latter group's costs can be renegotiated — offers more margin upside than any single regional or customer-level intervention identified in this report.

Visual Appendix

All supporting charts referenced in Section 4, plus the original source dashboard, are reproduced below at full size for reference.

Figure A1 — Original Source Dashboard

Power BI-style P&L dashboard as extracted for this analysis. Note the "Gross Profit" and "EBITDA" cards, and the two margin percentage cards, carry swapped labels as detailed in Section 2.

Methodological Note

This report was produced using the five-stage Description → Inquiry → Goal Setting → Analysis → Visualisation framework outlined in Section 3. All P&L figures were derived directly from the transaction-level Revenue, COGS, Operating Expense, Interest, and Tax fields using standard formulas — $\text{Gross Profit} = \text{Revenue} - \text{COGS}$, $\text{EBITDA} = \text{Gross Profit} - \text{Operating Expense}$, $\text{Net Profit} = \text{EBITDA} - \text{Interest} - \text{Tax}$, and each $\text{margin} = \text{its profit measure} \div \text{Revenue}$ — and cross-checked against both the dataset's own totals and the source dashboard, which is how the KPI mislabelling in Section 2 was identified.

Limitations. With 499 transactions spread across 4 regions, 20 products, and 220 customers, finer cuts (e.g. product performance within a single region, or monthly trend within a single region) would leave very few transactions per cell and were not attempted, as the resulting averages would not be reliable. The embedded Budget-vs-Actual series (Track E) operates at a different scale than the transaction data and could not be reconciled to a common denominator with the rest of this report; it is presented on its own terms rather than blended into the regional or product findings. Finally, this report reflects a rolling twelve-month window (Jul 2024–Jun 2025) rather than a fixed fiscal year, so any comparison to a calendar-year budget or prior-year report should account for the partial-year overlap on each end.

This approach supports structured reasoning and reproducibility: every number in this report can be traced back to either a transaction-level value or a stated formula applied to those values, so the analysis can be re-run and independently verified as new transactions are added.
